SUMMARY

Full-stack Computer Science graduate (Concordia, May 2026) with hands-on experience across **backend, frontend, and AI/ML development** — REST APIs, relational databases, and real production work integrating **AI coding agents (Claude Code)** and **LLM-powered systems** into live engineering workflows.

EDUCATION

Concordia University — Bachelor of Computer Science May 2026

PROJECTS

CodeBlue — AI-Powered Real-Time Triage System Jan 2026

- Real-time triage, grounded in precedent — built a Retrieval-Augmented Generation pipeline (ChromaDB + Gemini) into a live Python/Flask/JavaScript platform, not blind-guessing classification.
- Multiple concurrent live data streams handled without blocking, by developing multithreaded workflows.
- Unreliable classifications kept out of production, by stress-testing the system across diverse scenarios before trusting its output.

Club Management Platform — Database & Backend Services July 2025

- 20+ entity PostgreSQL schema (3NF) designed and normalized, with REST APIs for scheduling, payments, and membership management.
- Data integrity enforced across service boundaries — by implementing SQL constraints, transaction logic, and integration testing.

Network Traffic Anomaly Detection System Apr 2025

- 500,000+ records classified at scale — built a distributed Python pipeline benchmarking Random Forest, SVM, and KNN for anomaly detection.
- Model input quality and reproducibility improved, by applying feature engineering and documenting methodology.

Cybertruck — 3D Modeling & OpenGL Rendering Pipeline Feb – Apr 2025

- Real-time rendering pipeline built end-to-end (C++, OpenGL, GLFW, GLEW, GLM) — held smooth frame rates under live transformations and material shading.
- Full 3D vehicle asset modeled and textured from scratch in Blender for pipeline integration.

EXPERIENCE

Full-Stack Engineer — @Hack Cybersecurity Hackathon Platform Jan – Mar 2026

- Live production platform shipped end-to-end — designed backend REST APIs and a normalized PostgreSQL schema (Node.js) serving a multi-team hackathon platform.
- Recurring incident resolution time cut during peak-traffic live events, by performing root-cause analysis and deploying fixes in real time under production load.
- Every AI-generated suggestion reviewed against the codebase before merge, by integrating Claude Code into a Git-based Agile workflow without sacrificing code quality.
- Release cadence improved across a cross-functional team, by leading iterative planning and code review cycles.

Web Developer & Finance Lead — @Hack Cybersecurity Hackathon Feb 2024 – Present

- Full-stack platform delivered end-to-end, from registration through live event operations, for a large-scale cybersecurity hackathon.
- Live event operations kept running under real-time load, by diagnosing and resolving cross-stack bugs and performance issues during high-traffic periods.
- Event budget accuracy ensured across multiple stakeholders — by managing and reconciling all financial data while coordinating team priorities against fixed deadlines.

SKILLS

Languages: Java, Python, JavaScript, TypeScript, C++
Web & Backend: React, Node.js, REST APIs, PostgreSQL, SQL
AI/LLM: AI Coding Agents (Claude Code), Retrieval-Augmented Generation, LLM Integration (Gemini)
Practices: Git, Agile/Scrum, Unit & Integration Testing, Code Review
